

## *Henningsmoenicaris* n. gen. for *Henningsmoenia* Walossek & Müller, 1990 – correction of a name

D. WALOSSEK AND K. J. MÜLLER

The genus *Henningsmoenia* has recently been erected by us for a new, peculiar arthropod from the Upper Cambrian of Sweden, considered as a derivative of the early stem-lineage of Crustacea in the broad sense (Pan-Crustacea). This name, however, is preoccupied, since given to an ostracode genus of the superfamily Hollinacea by Schallreuter (1964). We therefore propose the new name *Henningsmoenicaris* n. gen. for the Upper Cambrian fossil. It is a composite of Henningsmoen, in honour of G. Henningsmoen, and caris meaning shrimp; the gender is feminine, as before.

We express our gratitude to Valdar Jaanusson, Stockholm, for directing our attention to this homonymy.
